ABSTRACT

The present parer concernes mainly with the plant species diversity of Al-Khoms - Misrata province. The survey of plant species of such area was taken in between 2018-2020. A total number of 375 different plants have been collected representing 62 families, 241 genera, and 375 species, of which 51 families and 307 species are belonging to dicotyledons, 8 families and 65 species belonging to monocotyledons, and 3 families belong to Gymnosperms each represented by only one species. The results of this study showed that the dominance of the family Asteraceae with 65 species, followed by the family Fabaceae with 48 species, the family Poaceae with 41 species, the family Brassicaceae with 20 species, the family Chenopodiaceae with 17 species, the family Liliaceae with 14 species, and the family Lamiaceae with 13 species. Other families are represented by 7 species or less. The present results have also shown that the dominance of the genera *Plantago* with 9 species, followed by *Ononis* and *Astragalus* with 7 species each. Analysis of lifeform spectrum have indicated that the predominance of therophytes with 218 species, followed by Hemicryptophytes with 61 species. However, chorotype spectrum analysis have shown that the dominance of Mediterranean with 164 species, followed by Mediterrean/Iranu-Turanean with 80 species.

Keywords: Plant diversity; flora; Al-Khoms; Misrata.

1. Introduction

The present study deals with the flora and plant diversity of Al-Khoms - Misrata province which are located about 120 -250 Km. east of Tripoli respectively. Libya is a North African country that lies between 18° 33' N. latitude & 9° 25' E longitude (Figure 1), and occupies an area of about 1, 759, 540 square kilometres [1], about 90% or more of which is deserted, except the coastal strip, Al Jabal El-Akhdar, and Jabal Nafousa regions [2], [3] indicated that the coastal belt extends from the Tunisian to the Egyptian borders is about 5.2%

of the whole country. The costal belt is quite fertile area that receives an adequate amount of rainfall in winter, particularly in the east and west, thus a great part of this belt exhibits the typical Mediterranean flora. The climate of the studied area is typical of the Mediterranean, characterized by the cool, rainy winter and a hot dry summer. Whereas, the climate over most of the country is hot, arid-semiarid Sahara, but it is moderated along the coastal littoral by the Mediterranean Sea [4]. The Libyan vascular flora consists of 2113 species belonging to 864 genera and 161 families, of which 2088 species, 844 genera, and 145 familes are angiosperms, 15 species, 8 genera, and 6 families are gymnosperms, and 15 species, 12 genera and 10 families are pteridophytes [5]. The distribution of Libyan seed plant species was

characterized by a high number of herbs (Annual to perennial), and low number of woods (tree and shrub); such distribution has an important influence on the structure of floral composition. The geographic element of the flora was predominantly Tropical and Mediterranean [6]. The floristic composition of plants in Libya is still relatively unknown regarding ecological and botanical studies [7].

The history of plant exploration in Libya has been done by several authors; the most important comprehensive floristic studies in Libya were in the form of a checklist of the flora of Libya by Keith [8], and Flora of Libya by Jafri and El-Ghadi [9]. Since the flora of Al-Khoms - Misrata district has not been studied thoroughly during the work on the flora of Libya (1976-1990) except for the study on the flora of selected regions of Misrata by Al-Dennaa and Buhadra [10]. Therefore, the main purpose of this survey is to have an exclusive study to the flora, and plant diversity of Al-Khoms - Misrata region.

1.1. Study area

This paper deals mainly with the flora, and plant diversity of Al-Khoms - Misrata district. Such region is located about 120 km., and 250 Km. east of Tripoli (Capital) respectively, and lies in between ($15^{\circ} 14' 46.55''$ N, & $39^{\circ} 32' 43.33''$ E, and $06^{\circ} 15' 18.29''$ N, $19^{\circ} 32' 57.35''$ E). The studied region ranges between 100-500 m above the sea level as measured by GPS. Al-Khoms - Misrata district is bounded by the sea to the north, Gasr Al-Akhiar to the west, Tawergha to the east, and Al-Karim to the south (Figures 1&2). The climate of Al-Khoms - Misrata follows the climate of the Mediterranean region, which is cold & rainy at the winter with an average rainfall, ranges between 100-300 mm annually, and hot - dry at the summer with a mean of 18°C [5]. Climate is one of the most important factors affecting biodiversity, vegetation distribution, and soil composition, while, and the high temperature affects vegetation and the dominant species [11].

Fig.1. Map of Libya showing the study area.

Fig. 2. Showing location of the study area.

2. Methods

A total number of 375 different plant specimens were collected by the authors in between 2018-2020 upon various field trips about one trip per month. The collected plants were then treated by the usual herbarium procedures including pressing, poisoning, mounting, labeling, and identifying. Identification of plants was done by the authors, using the following literatures [8, 9, 12]. Eventually, the identified plant specimens were deposited at the national herbarium, Botany Department, Faculty of Sciences, University of Tripoli.

3. Results

By the end of the survey, a total number of 375 different plant taxa belonging to 62 families, such number of species includes three different plant groups, these are gymnosperms with three families with one species each, dicotyledons with 51 families and 307 species, and monocotyledons with 8 families and 65 species (Table 1). The families Asteraceae, Fabaceae, Poaceae, and Brassicaceae, are considered as the most dominant and sizable families with 65, 48, 41, and 20 plant species respectively. Other families such as Chenopodiaceae, Liliaceae and Lamiaceae are less dominant and represented by 17, 14 & 13 species respectively (Table 2). Whereas, the rest of the families are represented by 7 species or less.

Table 1. Shows the three groups of plants included in this

Group	No.of Families	Species
Gymnospermis	3	3
Dicotyledons	51	307
Monocotyledons	8	65

Table 2. Shows the dominant families.

Family	No. of species	%
Asteraceae	65	17.3
Fabaceae	48	12.8
Poaceae	41	10.9
Brassicaceae	20	5.3
Cheopodiaceae	17	4.5
Liliaceae	14	3.7
Lamiaceae	13	3.4

The most dominant genera are *Plantago* with 9 species, followed by *Ononis* and *Astragalus* with 7 species each, whereas, genera such as *Medicago*, *Erodium*, and *Euphorbia* are represented by 6 species each, while *Centaurea* represented by 5 species, and *Silene*, *Helianthemum*, *Cheopodium*, *Bromus*, and *Asphodelus* represented by 4 species each. Other genera represented by 2-3 species or less (Table 3).

Table 3. Shows the dominant genera.

Genus	No. of species
<i>Plantago</i>	9
<i>Ononis</i>	7
<i>Astragalus</i>	7
<i>Medicago</i>	6
<i>Euphorbia</i>	6
<i>Erodium</i>	6
<i>Centaurea</i>	5
<i>Silene</i>	4
<i>Helianthemum</i>	4
<i>Cheopodium</i>	4
<i>Bromus</i>	4
<i>Asphodelus</i>	4

The analysis of life form spectrum of the species based on Raunkiae system [13] as modified by Govaerts et al. [14]. The results of analysis showed the absolute dominance of Therophytes with 218 species, followed by Hemicryptophytes with 61 species, Chaemephyses with 38, and Geophytes with 37 species. The other life forms were less frequent, for example, Nanophanerophytes with 16 species, and Phanerophytes with 5 species (Table 4).

Table 4. Shows lifeforms

Lifeform	No of species	%
Therophytes	218	58.1
Hemicryptophytes	61	16.3
Chaemephyses	38	10.1
Geophytes	37	9.9
Nanophanerophytes	16	4.3
Phanerophytes	5	1.3

Chorological spectrum of collected and identified plant species were analyzed as well, and the results showed an absolute predominance of Mediterranean plants with 165 species, followed by Med./ Ir-Tu. species with 80 species, whereas, the other chorological spectra were with little frequent as appered in (Tables 5,6).

Table 5. Shows chorotypes.

Chorotype	No. of species	%
Med	165	44.0
Med./ Ir-Tu.	80	21.3
Med. / Ir-Tu./ Eur-Si.	27	7.2
Sah-Ar.	22	5.9
Plu	20	5.3
Med. / Eur-Si.	13	3.5
Med./ Sah-Ar.	7	1.9
Cos	5	1.3
Med./ Ir-Tu./ Sah-Ar.	5	1.3
Ir-Tu./ Sah-Ar.	4	1.06
Trop	4	1.06
Sah-Ar. / Sud.	4	1.06
Med. / Ir-Tu./ Sud.	3	0.8
Sud.	3	0.8
Ir-Tu	2	0.5
Eur-Si.	2	0.5
Med./ Eru-Si./ Sah-Ar.	2	0.5
Med. / Sud.	2	0.5
Americas	1	0.3
Australia	1	0.3
Med./ Canaries.	1	0.3
Med./ Ir-Tu./ Trop.	1	0.3
Sah-Ar./ Sud./ Ir-Tu.	1	0.3
Sud./ Sah-Ar.	1	0.3

The dominance of familes Asteraceae, Fabaceae, and Poaceae were expected since such families are dominated the Mediterranean climate conditions. In addition to that, the families are cosmopolitan in distribution and the dominance of Therophytes and Mediterranean chorotypes agreed with our expectations as well because the investigated area is fall within the coastal Mediterranean region in which the

Mediterranean Therophytes are dominating. Moreover, the results have revealed that the most characteristic features of the flora of Al-Khoms-Misrata are the large number of families, which is close to the half number of the total number of families included in the flora of Libya, and this result indicates that the flora and plant diversity of Al-Khoms-Misrata is rich.

4. Conclusion

The present study is the first research to investigate the floral diversity of the study area. The study revealed presence of 375 different plant species representing 62 families. The family Asteraceae was the most dominant with 65 species. The results have also shown that the genus Plantago, and is the most sizable genus with 9 species. Lifeform spectrum analysis have shown the predominance of therophytes with 218 species, while chorotype spectrum analysis have shown the dominance of Mediterranean species with 164 species.
